

PROMPT-DRIVEN BUILD

ServiceNow Inventory App

Build it with Claude Code, one prompt at a time

Uses the `fluent:now-sdk-explain` SDK skill

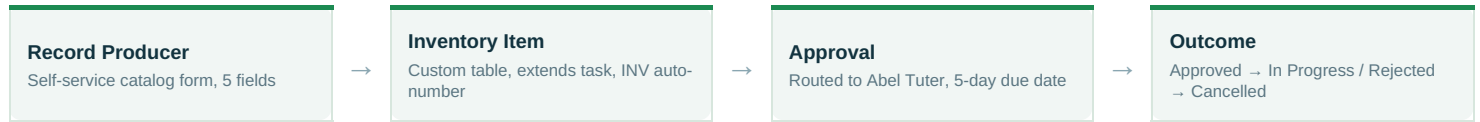

Stack ServiceNow SDK (Fluent), Claude Code, Node.js 20+

You will build Record Producer form → Inventory table (extends task) → Approval to Abel Tuter

Format 7 paste-ready prompts, plus an end-to-end sequence diagram

WHAT YOU WILL BUILD

A self-service Service Catalog request that captures inventory details, creates a record in a custom **Inventory Item** table extended from `task`, routes it to **Abel Tuter** for approval, then updates the record state based on the decision. You build the whole thing through Claude Code, one prompt per step.

HOW TO USE THIS PLAYBOOK

RUN IN ORDER Each step is a prompt you paste into Claude Code. Run them in order. Claude uses the `fluent:now-sdk-explain` skill to look up the correct SDK APIs before writing any code, so you stay in plain language and never hand-write the Fluent definitions yourself.

01

Scaffold the Project

Initialise the scoped app, install, authenticate

>_ Prompt for Claude Code

COPY & PASTE

Use the ServiceNow SDK skill to scaffold a new scoped application called "Inventory Management". The scope name should follow the `x_<company_code>_inv_mgmt` pattern. Ask me for the company code before proceeding. After scaffolding, run `npm install` and configure authentication against my instance. Walk me through any inputs you need.

02

Create the Inventory Table

A table that extends `task`, five custom fields

>_ Prompt for Claude Code

COPY & PASTE

Use the ServiceNow SDK skill to create a Fluent table definition for an Inventory Item table. It must:

- Extend the task table
- Use the prefix `INV` for auto-numbering
- Include these custom fields: Item Name (text, mandatory), Category (dropdown: Hardware / Software / Peripherals / Other), Quantity (integer, mandatory, default 1), Business Justification (multi-line text, mandatory), and Location (text)
- Be placed in `src/fluent/tables/`

03

Create the Record Producer

The catalog form, mapped variables, pre-insert script

>_ Prompt for Claude Code

COPY & PASTE

Use the ServiceNow SDK skill to create a Record Producer for the Inventory Item table. It must:

- Appear in the Service Catalog under a category I will provide
- Have one variable per custom field from the Inventory Item table, each mapped directly to the corresponding field
- Include a pre-insert script that sets the `caller_id` to the submitting user and auto-populates `short_description` as "Inventory Request - {item name}"
- Redirect the user to the generated record on submission
- Be placed in `src/fluent/catalog/`

04

Create the Approval Flow

Route to Abel Tuter, branch on approve or reject

>_ Prompt for Claude Code

COPY & PASTE

Use the ServiceNow SDK skill to create a Flow Designer flow that:

- Triggers when a new Inventory Item record is created
- Sends an approval request to Abel Tuter (ask me for his sys_id) using the askForApproval action
- Sets a 5-day due date after which the request is auto-rejected
- On approval: updates the record state to In Progress and adds a work note
- On rejection: updates the record state to Cancelled and adds a work note
- Runs as system in the background
- Be placed in src/fluent/flows/
- Remind me to activate the flow manually in Flow Designer after deployment

05

Wire and Build

Re-export every artifact, then compile

>_ Prompt for Claude Code

COPY & PASTE

Update src/fluent/index.now.ts to re-export all artifacts created so far, the table, record producer, and flow. Then run `npx @servicenow/sdk build` and fix any errors that appear.

06

Deploy

Install to the instance, then post-deploy checklist

>_ Prompt for Claude Code

COPY & PASTE

Run `npx @servicenow/sdk install` to deploy the app to my instance. If any errors occur, diagnose and fix them. After a successful deploy, give me a checklist of manual post-deploy steps I need to complete in the instance (activating the flow, verifying catalog visibility, testing the approval with Abel Tuter).

07

End-to-End Test

Verify the submit, approve, and reject paths

>_ Prompt for Claude Code

COPY & PASTE

Help me verify the app works end to end. Walk me through:

1. Submitting a request as a non-admin user from the Service Catalog
2. Confirming the INV record was created with the correct field values
3. Approving as Abel Tuter and confirming the state moves to In Progress
4. Submitting a second request and rejecting it, confirming the state moves to Cancelled

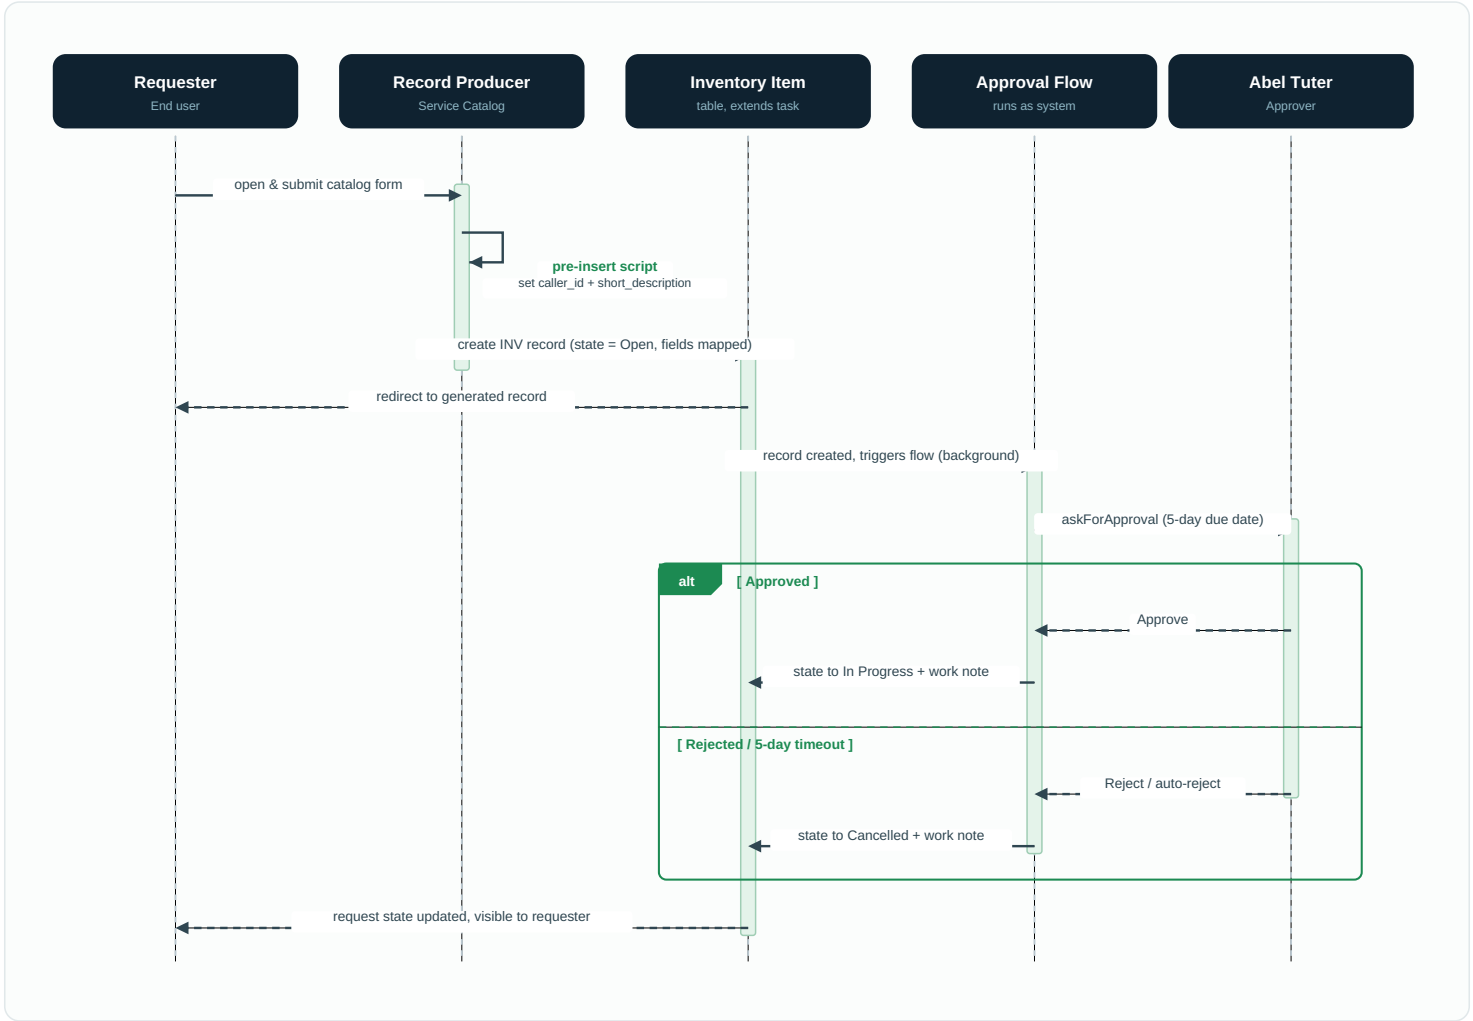

RE-RUNNABLE Each prompt is self-contained. If something goes wrong in a step, you can re-run just that prompt without redoing the whole playbook.

End-to-End Architecture

How a request flows through the running app

Once deployed, this is the runtime path of a single request, from catalog submission to the approved or rejected outcome.

— call - - - response / return □ alt · conditional branch
