

Connect n8n to Claude with MCP

Build and publish an automated workflow, from Claude, using the n8n MCP server.

Companion guide • AI by Tushar M • youtube.com/@aibytusharm

Part 1 — Connect n8n to Claude

1 Create or open an n8n workflow

Open your n8n cloud instance and create a new workflow, or open an existing one you want to work with.

2 Open the instance-level MCP server

Go to **Settings** and open the instance-level MCP configuration. This exposes your n8n instance as an MCP server.

3 Copy your access token and MCP URL

From the MCP settings, copy two things: your **access token** and your **n8n MCP server URL**.

4 Add the MCP server to Claude

Register the server with Claude by running the command below. Replace the URL with your own instance URL and swap in your real token.

```
claude mcp add n8n-mcp --transport http \
  https://yajna.app.n8n.cloud/mcp-server/http \
  --header "Authorization: Bearer YOUR_TOKEN"
```

Tip: keep the token out of screen recordings, and regenerate it after filming if it was ever visible.

5 Open Claude

Launch Claude. The n8n MCP tools are now available to it.

Part 2 — Build the workflow with Claude

6 Ask Claude to create a workflow

You can now describe the automation you want in plain language and Claude will build it in n8n through the MCP tools.

7

Example: a ServiceNow incident triage agent

Here is a working example prompt you can adapt. It points Claude at a ServiceNow instance and asks for a triage agent that routes incidents by assignment group.

```
Can you create a triage agent? This is my ServiceNow incident instance:  
https://dev422303.service-now.com    Detect the assignment group based on the  
incident's short description.
```

8

Set the trigger and add AI triage

Make sure the workflow trigger is a **webhook**, and use an AI node to do the triage logic, mapping the short description to the right assignment group.

9

Use the free AI credit for testing

n8n provides **\$5** in free AI usage. Use that credit to test the OpenAI node while you validate the flow, no separate key needed to get started.

10

Approve validation and publish

Review Claude's proposed workflow, approve the validation step, then publish the workflow so it is live.

Part 3 — Trigger it from ServiceNow

11

Create a Business Rule in ServiceNow

In ServiceNow, create a **Business Rule** that calls your n8n webhook so new incidents fire the workflow automatically.

12

Let it run

Create or update an incident to trigger the rule, then watch the triage agent detect the assignment group end to end.

That is the full loop: n8n exposes an MCP server, Claude builds the workflow, and ServiceNow triggers it through a Business Rule.
