

Build a ServiceNow AI Agent

Incident Investigation & Data Extraction Agent · Claude Code + ServiceNow SDK (Fluent)

An agent that fires when an incident moves to **In Progress**, reads the short description and description, runs targeted web searches via Apify, synthesizes findings, and posts a structured HTML investigation report to the work notes.

Prerequisites

- Node.js 18+ and npm, plus Claude Code set up (walkthrough: youtu.be/DUTutpMFGWs).
- A ServiceNow instance with admin access and the AI Agent plugins enabled.
- An Apify account, with an API token from console.apify.com/account/integrations.

Get the agent (two ways)

A · Prompt it

Paste into Claude Code and let it build the action and agent:

Create a ServiceNow AI Agent that runs when an incident goes to In Progress. It is an investigation and data extraction agent. From the short_description and description, do a web search, investigate, find a solution or recommendation, and paste it as an HTML report in the comments. Use Apify for the web search via a tool backed by a Flow Designer custom action that calls the Apify actor with a REST Message in the action's script step.

B · Clone the repo

Grab the ready-made build, then install deps:

```
git clone https://github.com/yvain13/SN_AI_Agents.git
cd SN_AI_Agents
npm install
```

Star the repo, more agents are dropping here.

Deploy & activate (both paths converge here)

1. Authenticate the SDK

now-sdk auth save myinstance --host https://your-instance.service-now.com --username your-user --default
2. Create system property

Name: apify.api.key · Value: your Apify API token.
3. Build

now-sdk build
4. Deploy to instance

now-sdk install --auth myinstance (or npm run deploy if aliased)
5. Activate the trigger

Trigger deploys as active: false. In AI Agent Studio open your agent, go to Triggers, and activate it.

What's inside the repo

src/fluent/actions/apify-web-search.now.ts

Flow Designer custom action **Apify Web Search**. Input: query (string). Output: search_results (JSON array). A script step (required_run_time: instance) uses sn_ws.RESTMessageV2 to POST to apify-web-search/run-sync-get-dataset-items, reading the token from system property apify.api.key.

src/fluent/agents/incident-investigation-agent.now.ts

AI Agent triggered when an incident hits In Progress (state = 2), wired with three tools:

Tool	Type	Purpose
Lookup Incident	CRUD	Fetches short_description, description, and sys_id.
Apify Web Search	Action	Searches the web via the Apify actor for solutions.
Post Investigation Report	Script	Writes the HTML report to work_notes via GlideRecordSecure.

Agent instructions: run 2 to 3 targeted searches, synthesize findings, and post a structured HTML report covering root causes, recommended solutions, workarounds, references, and next steps.
