

Part 1: Setup

Sep 27, 2026 · @Tushar Mishra

Goal: go from zero to an AIUX project in VS Code, connected to your instance.

Where this sits: Part 1 Setup → Part 2 Build Experience → Part 3 Learn Lit.js → Part 4 Connect to Server

Steps

1. **What we are building in this series**
   - A LUX page (Part 2)
   - A LUX Lab widget on that page (Part 3)
   - The widget pulling live data from the instance (Part 4)
2. **Check the instance**
   - Zurich Patch 9 or later
   - Admin access (or `aix_widget_admin` / `aix_canvas_admin`)
3. **Install the AIUX store apps**
   - `sn_aiux_ia_config`
   - `sn_aiux_builder`
   - `sn_aiux_components`
4. **Quick look at the Builder in the browser**
   - `/aiux/builder/widgets`
   - We will build in code instead
5. **Prepare the machine**
   - Node.js installed
   - VS Code installed

- ServiceNow SDK installed

6. **Connect VS Code to the instance**
   - Save an auth profile: `now-sdk auth save <alias> --host <instance URL> --username <user> --default`
   - Confirm the connection works
7. **Scaffold the AIUX starter application**
   - Open the project folder in VS Code
8. **Tour the project structure**
   - `pages/`: pages of the experience
   - `widgets/`: reusable widgets (starter: `aiux-hello-world`)
   - `components/`: small UI pieces (starter: feature card)
   - Each widget = component file + server script
9. **First build and deploy**
   - Build, install to the instance
   - Open the starter experience in the browser
10. **Checkpoint**
    - Starter home page loads on the instance

Next: Part 2, Build Experience. We turn the starter home page into our own LUX page.
